
Supplementary Figure 4. Prediction of clinical outcomes according to combined HGF and soluble cMet concentrations. Group 1, low HGF and low cMet; group 2, low HGF and high cMet; group 3, high HGF and low cMet; and group 4, high HGF and high cMet. (A) The risk of all-cause death was not significantly different among groups at D0 (p = 0.14). (B) Group 1 had a significantly higher mortality rate than other groups (p = 0.04). (C) Differences among groups were statistically significant at D7 (p = 0.02).
D, day; HGF, hepatocyte growth factor.
