

Supplementary Figure 1. Kaplan-Meier curves of patient or technique survival rates by HGS group in participants matched based on propensity scores. (A) The patient survival rates in patients with normal and low HGS were 97.2% and 93.2% at 200 days and 95.7% and 76.7% at 600 days, respectively. (B) The technique survival rates in patients with normal and low HGS were 91.9% and 87.9% at 200 days and 85.5% and 71.3% at 600 days, respectively. HGS, handgrip strength.
