

Supplementary Figure 2. Changes in C statistics with the addition of KDIGO risk category (or PCEs 10-year risk category) to the PCEs (or three-variable) models.

*The marked C statistics were calculated in the models with a covariate of PCEs 10-year risk. Base C statistics were calculated in the three-variable models that included age, sex, and KDIGO risk category.

ASCVD, atherosclerotic cardiovascular disease; CI, confidence interval; KDIGO, Kidney Disease: Improving Global Outcomes; PCEs, Pooled-Cohort-Equations.
