

Supplementary Table 3. Comparison of the all-cause mortality and the start of renal replacement therapy in groups A and B in patients who received multidisciplinary care in outpatient setting using Cox proportional hazards models adjusted for confounding factors

Group	Unadjusted		Model 1		Model 2		Model 3	
	HR(95% CI)	p-value	HR(95% CI)	p-value	HR(95% CI)	p-value	HR(95% CI)	p-value
A	1.00 (Reference)	-	1.00 (Reference)	-	1.00 (Reference)	-	1.00 (Reference)	-
B	0.80 (0.62–1.03)	0.08	0.81 (0.62–1.06)	0.13	0.87 (0.65–1.15)	0.34	0.76 (0.54–1.06)	0.11

Age, sex, cardiovascular disease history, and presence or absence of diabetes mellitus were all basic characteristics that were adjusted for in model 1. Model 2 was adjusted for estimated glomerular filtration rate and urinary protein levels at baseline in addition to factors of model 2. Model 3 was adjusted for body mass index, serum albumin, and hemoglobin levels at baseline in addition to factors of model 2.
CI, confidence interval; HR, hazard ratio.
