

Supplementary Table 4. Comparison of the all-cause mortality and the start of renal replacement therapy in groups C and D in patients who received multidisciplinary care in inpatient setting using Cox proportional hazards models adjusted for confounding factors

Group	Unadjusted		Model 1		Model 2		Model 3	
	HR(95% CI)	p-value	HR(95% CI)	p-value	HR(95% CI)	p-value	HR(95% CI)	p-value
C	1.00 (Reference)	-	1.00 (Reference)	-	1.00 (Reference)	-	1.00 (Reference)	-
D	0.59 (0.48–0.71)	<0.0001	0.51 (0.42–0.62)	<0.0001	0.55 (0.45–0.68)	<0.0001	0.56 (0.45–0.69)	<0.0001

Age, sex, cardiovascular disease history, and presence or absence of diabetes mellitus were all basic characteristics that were adjusted for in model 1. Model 2 was adjusted for estimated glomerular filtration rate and urinary protein levels at baseline in addition to factors of model 2. Model 3 was adjusted for body mass index, serum albumin, and hemoglobin levels at baseline in addition to factors of model 2.
CI, confidence interval; HR, hazard ratio.
