

Supplementary Figure 2. Comparison of taxonomic compositions between control and ESKD groups (antecubital fossa). Averaged taxonomic compositions of control and ESKD patient groups in the antecubital fossa. Taxonomic relative abundance was classified at the (A) phylum, (B) class, (C) order, (D) family, and (E) genus levels, and relative abundances of less than 1% were expressed as 'Others.' The Wilcoxon signed-rank test was used to analyze the significance between the two (* $p < 0.05$, ** $p < 0.01$). ESKD, end-stage kidney disease.
